

Introduction-Website

A Website which introduces me to my Class. It's a Website about my IT-skills from then and about other aspects of myself like Education and Hobbies.

Initial Situation

I started in my IMS education and to get to know the Class better we were allowed to create a website about oneself. It had to include our IT knowledge and a bit about ourselves.

Goal

A Website with a Navigation and five separate Sites, which can switch between German and English and vice versa. Each Page aligns with the general Design and inherits the Colour concept and Font concept. A functional Navigation to the class page is on the page.

Implementation

We had one month, to create a concept of the Website including a completed Timetable, a Colour and Font concept, blueprints of the separate Subpages, Goals, Target audiences, a rough concept and a detailed concept. All of that was handed in as a concept report.

I had five months to do the programming. I used Visual Studio Code as my IDE and the languages I used were HTML, CSS and a bit of JS.

The Timetable from the initial concept had to be redone three times. I also created an amendment for some of the style elements which I altered or added.

Result

A simple Website was created; it has a functioning navigation and language switcher. I was able to meet every acceptance criterion, and I was able to achieve my own Goals as well. The Presentation went well and the audience was in the end happy with the result.

Findings / Insight

I had made the language switcher very data intensive, since I created two .html Files per subpage. Additionally, I created for each Subpage their own .css File instead of creating one global CSS. In hindsight I could have implemented this functionality better, but I have learned a lot from these Mistakes.
